

EC  ***Master***

Feature Pack UDP Mailbox Gateway

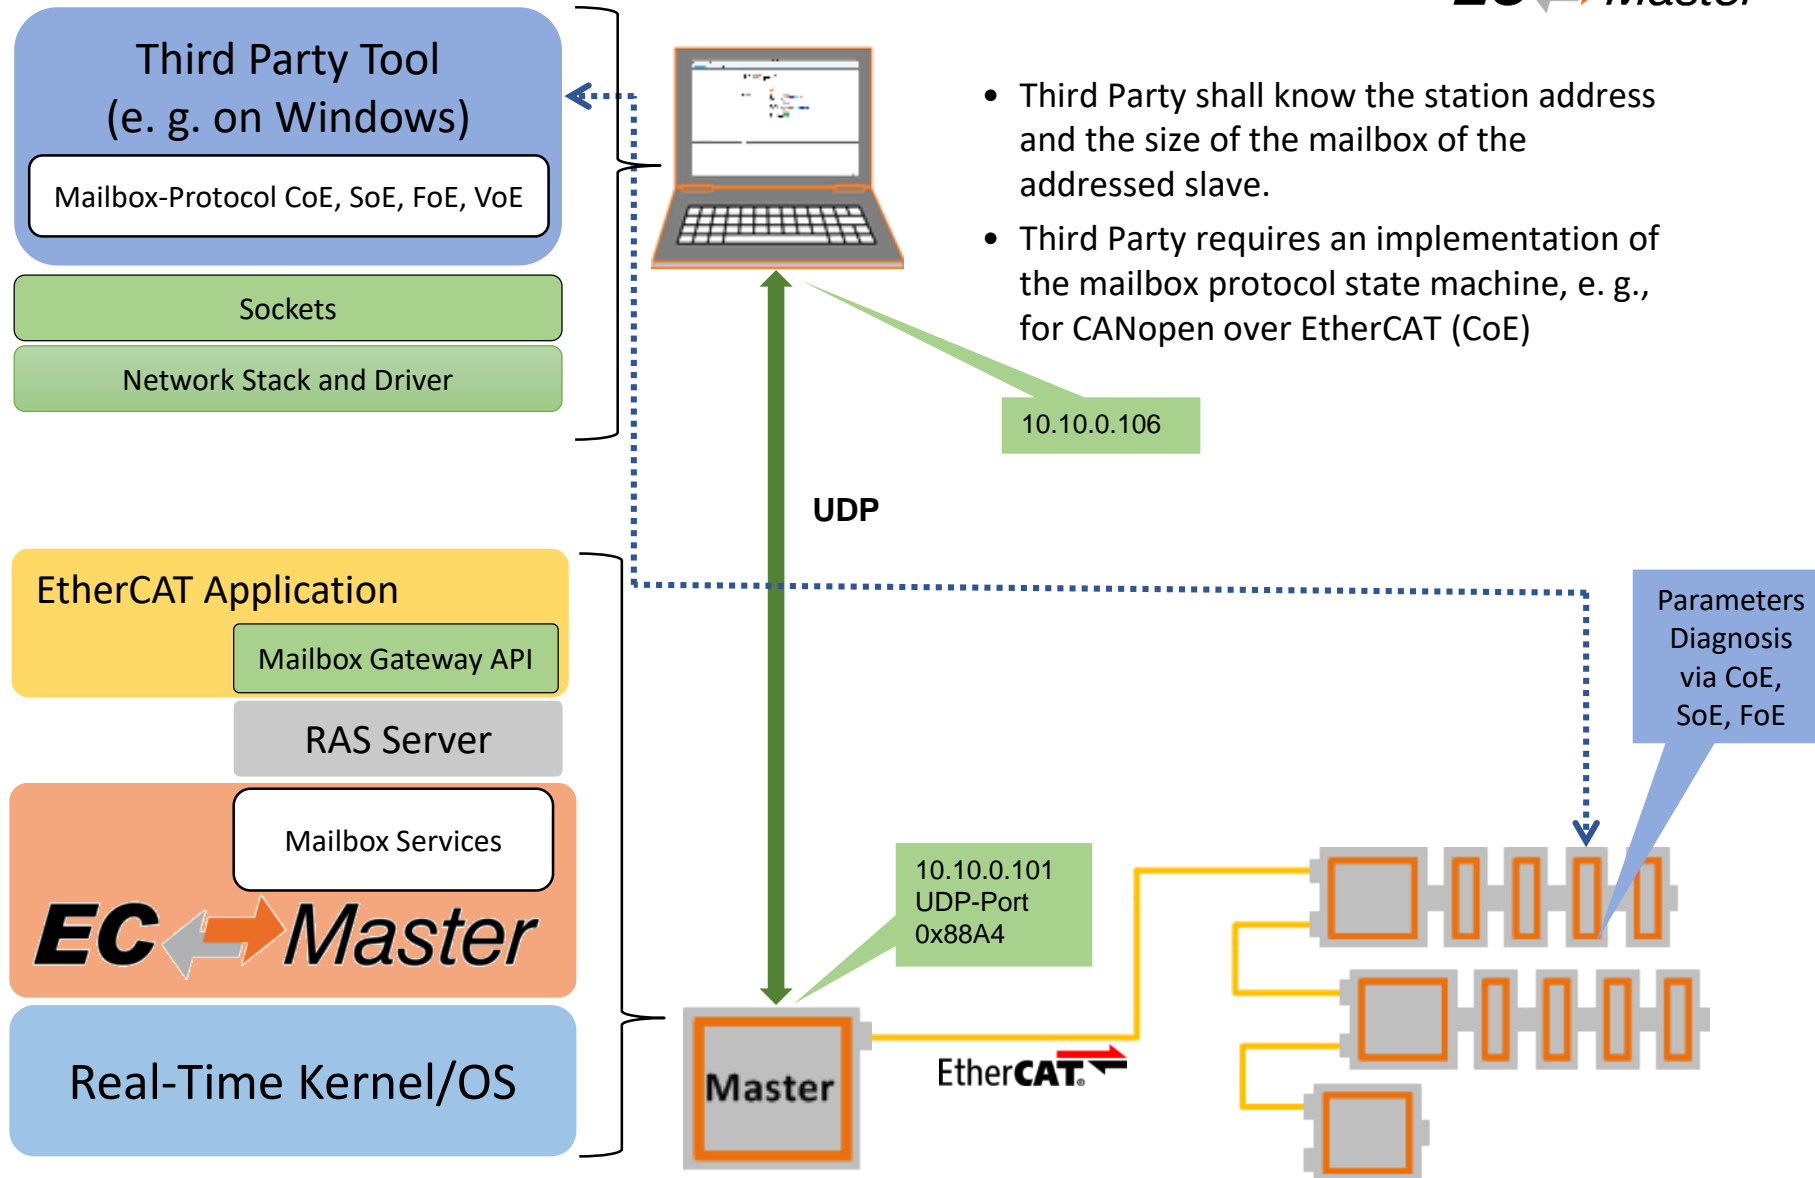

Feature Pack UDP Mailbox Gateway

Use Case

- The Mailbox Gateway functionality within a master device can be used to route the EtherCAT mailbox protocol from an (external) device configuration tool via the Mailbox Gateway to the EtherCAT devices and vice versa.
- All Mailbox protocols that are defined in the EtherCAT specification can be used in general, i.e. CoE, FoE, VoE, SoE.
- There is no error handling specified for the Mailbox Gateway functionality. A request to a non-existing slave device can lead to no response from the master.
- According to Function Guideline „ ETG.8200 EtherCAT Mailbox Gateway“
